An AIS Project Manager Tool

AIS FastEntry for AccountMate

With its simple user interface, advanced integration, and fewer moving parts than other remote tracking apps, AIS FastEntry speeds up the processes of posting time updates and tracking activity statuses.

No more guessing on profitability—know exactly what your job status is and where you can improve your margins on the next job.

Get complete tracking of job status, labor hours, materials used and finished goods—your workers can instantly send details automatically from their Android phone that automatically post to AccountMate's payroll, job costing, manufacturing, and project management.

Do you need faster field-level time entry?

Any worker can quickly learn how to log in to FastEntry on their phone to “punch in” and start the time clock. Then they simply scan a bar code or tap a button each time they start work on a new job, change the type of work they’re doing, or use additional materials for their project.

- It's directly integrated with AccountMate which means you do not have to purchase user licenses for job sites because all the tracking happens on remote devices.
- It costs less per user than other time card apps because of its unique multi functions and universal development.

Everything is connected. That means the time, materials and finished goods data in AccountMate also makes it easier to manage projects, do job costing, and track your profitability.

Get true costing of your jobs

Each worker’s phone scans bar codes associated with the job number and type of work they are doing, while it keeps track of the time they spend.

FastEntry automatically associates all time and materials used to the appropriate orders in AccountMate. This makes job costing and assessing profitability easy and accurate.

Simplify your project management and communications

- When workers use FastEntry to log their time spent and to scan in materials as they use them, this information immediately appears in AccountMate.
- This gives you transparency across the company. Users can see the Activity Statuses change as time and materials are entered from the field or shop floor. For manufacturers, finished goods can be posted as well, giving all users awareness that the Job is ready for delivery without any phone calls or emails.
- When everything is interconnected like this, your whole team has visibility into the project. Requirements planning is simplified, work is documented as it happens, and profitability is easily assessed.

How AIS FastEntry works

Remote Time Entry

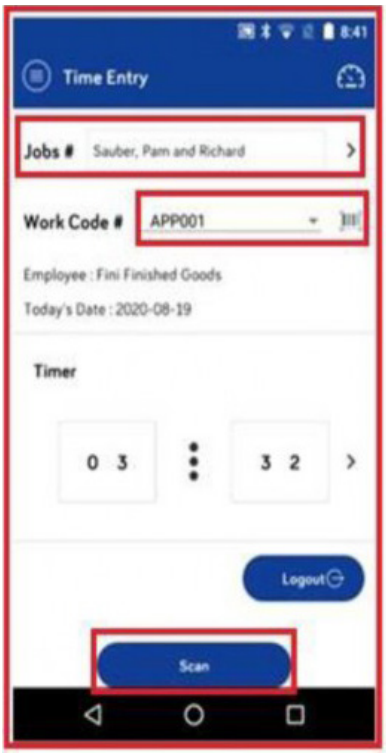
- Workers use their phone to log in and start the clock. They scan a bar code for the job number, work order number, and/or labor type to track their time against. Or they can touch a button on their screen instead of scanning a bar code.
- When that work is finished, workers simply scan a new number to start tracking their time against their next project.
- Time logs are automatically uploaded to the payroll system along with the codes to automatically assign that time to the appropriate job, work order, and/or type of labor.

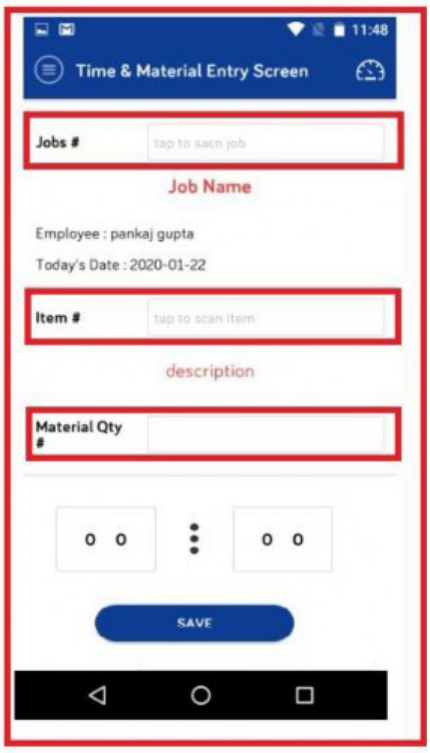
Remote Material Entry

- Workers use their phones to scan in the materials they use as they work, which automatically assigns those materials to the current job number.

Remote Finished Goods Entry

- Workers manufacturing goods can use a phone to mark them as finished and put away, by recording the quantity per line item for a job number, work order, or for general inventory. This will update the amount available on hand.





Flexible deployment options

Use FastEntry by itself, or as part of AIS Project Manager to manage and build complex or custom jobs Track time for payroll only, or add tracking for materials and finished goods, too:

- **Payroll**: Posts time to payroll
- **Manufacturing**: Posts time, materials and finished goods to work orders
- **Field Services & Installation**: Posts time and/or materials to jobs
- **Project Management:** Simplify processes, improve communication, gain strategic visibility

Keep track of labor hours by person, materials used, and finished goods on hand—and automatically assign these to job numbers and work orders that also roll up to sales orders.

Get FastEntry for your business

The first step is to have a conversation with us about how your business tracks remote work today versus how you want to track it. Reach out to us today. We look forward to learning about your business and discussing technology automation that will make your work easier.

AIS: A technology partner that lowers your cost and risk

ANALYSIS & INFORMATION SERVICES
Expert Automation with Integrity

AIS uses software to build a system that allows people to respond to what happens in their business in a way that's designed to be easily modified.

Our experts first listen to people at all levels of the company before designing a solution. They compare current processes to what they could be, mapping business pains to positive solutions. That assessment is the human part.

With this personalized assistance, plus flexible technology, companies can have their wish lists fulfilled. Low cost and high impact changes bring high-value benefits. You have more time to implement growth opportunities and explore what else your company is capable of.

Modular tools are available that snap-in, if and when they're needed. A flexible system lasts for decades. Many of our clients were burned by previous mid-tier or high-end solutions that cost them millions and never produced a positive result. With AIS, people soon discover that they can stop hesitating and start moving their business forward—and faster. Together we can quickly implement powerful changes and innovations with a very high return on your investment.

People don't expect it, but once they see what's possible, they generate business ideas on a higher level. Let's start a conversation about your custom automation solution.
